Abstract

Background: Because of the increasing incidence of infections with different types of influenza of various types, type A, B, and SRV, this study included investigating the type of infection in influenza in women and men in different age groups and making a comparison between them. **Methodology:** 90 blood samples were collected, including 30 samples for men 30 samples for women showing clinical symptoms of infection, and 30 samples from people with clinical symptoms under control. These samples were placed in tubes containing an anticoagulant to ensure that blood does not clot DNA/RNA extraction kit, CerTest, Spanish Company and detection by Flu A, Flu B and RSV, CerTest, Spanish Company by using real time PCR. **Result**: Table 1 shows the investigation of some types of influenza in women who showed symptoms of infection and who are between 20 to 40 years old, where the frequency of infection in women between the ages of 20-30 years was high with types Flu A, SRV compared with control and did not show infection with type B for the same Age group. As for women aged between 30-40 years, the frequency of type B infection was high compared to control, and there were no infections with Flu a and SRV for the same age group.

Keyword: Real time PCR, Flu A, Flu B and RSV

Introduction

There are three sorts of seasonal influenza A, B, and C. Type A influenza viruses additionally department into subtypes in accordance to combos of two unique proteins, haemagglutinin (H) and neuraminidase (N), placed on the floor of the virus. (1.2) Among the many influenza A virus subtypes,

Corresponding: Najeeb Mohammed dr.najeb@uoanbar.edu.iq the two subtypes A (H1N1) and A (H3N2) are currently circulating in humans. (3,4) The communicable influenza virus A (H1N1) is referred to as A (H1N1) pdm09 as it brought about pandemic influenza in In 2009 it due to this fact changed the seasonal influenza A (H1N1) virus that used to be circulating earlier than 2009. Influenza viruses by myself are recognized to purpose pandemics. (5,6) Influenza B viruses can be divided into two most important training (strains) referred to as the B / Yamagata stress and the B / Victoria strain. Type B influenza viruses are no longer categorized as subtypes. (7,8) Influenza viruses of kind A and B flow into and motive outbreaks and epidemics. (9,10) For this reason, the applicable lines of influenza viruses A and B are covered in seasonal influenza vaccines. Influenza C virus is detected solely in uncommon instances and typically motives slight infections and for this reason has much less extreme public fitness effects.(11,12) Seasonal flu is characterised by way of a unexpected excessive physique temperature, cough (usually dry), headache, muscle and joint pain, extreme nausea (malaise), sore throat, and runny nose. You can have a extreme cough that lasts two weeks or more. Most sufferers unravel their fever and different signs and symptoms inside one week besides desiring scientific attention. However, influenza can reason extreme sickness or even dying if it impacts one of the high-risk businesses (see below).(13,14) The duration between the acquisition of the contamination and the onset of the disease, recognized as the incubation period, lasts about two days. (15)

Methodology

Samples collection

90 blood samples were collected, including 30 samples for men 30 samples for women showing clinical symptoms of infection, and 30 samples from people with clinical symptoms under control. These samples were placed in tubes containing an anticoagulant to ensure that blood does not clot

RNA Extraction and Detection

DNA/RNA extraction kit, CerTest, Spanish Company and detection by Flu A, Flu B and RSV, CerTest, Spanish Company by using real time PCR ..(16)

Reagents and equipment to be supplied by the user The .(17)

Creating PCR test programmer VIASURE Flu A, Flu B & RSV Real Time PCR Detection kit . (3)

Result and Discussion

All flu subtypes contain different strains of the influenza virus. Not all strains infect people. Subtypes of influenza A viruses that currently appear in people are H1N1 and H3N2 strains. Each year the influenza vaccine contains a variety of these two strains and influenza B. In most cases, the body's immune system will fight the virus itself. But some people will experience additional complications. These complications are more common in older adults and those with conditions that affect their immune systems. Taking immunosuppressant medications may also increase the risk of complications.

Table (1) Screening for the three types of influenza (Flu A, Flu B, SRV) in women whose ages range from 20 to 40 years old

| | Descript | tive Statistics | | | |
|--|-------------|-----------------|----------------|----|--|

Table 2: Analysis of variance for the detection of the three types in women whose age ranges between 4-20 years, as it was noted that there are significant differences between influenza type A for women within the age group 20-30 years compared to control and compared to the age group between 30-40 years while the second type From influenza B, there were clear significant differences in the large age groups, located between 30-40, compared to control and also compared to the younger age groups.

Epidemiological data from Hong Kong showed that adult men are more at risk of hospitalization due to influenza. An American study revealed that men died more often from influenza compared to women of the same age, regardless of other underlying diseases such as heart, cancer, and organs It was found that this gap in immunity, may be caused by hormonal changes, as the male hormone testosterone suppresses the immune system, while the hormone estradiol protects it. It is not usually known that testosterone is an immunosuppressive, but one study found that men who have levels The higher testosterone they have had less response than the vaccination antibody. Table 3 shows the investigation of the three types of influenza in men whose age ranges between 20-40 years. It was found that there are infections in men whose ages range from 20-30, as well as men between the ages of 30-40 years in influenza type A and no infections have appeared. The other is type B and SRV.
