

Studying the effect of diesel Power Generator noise on the publicity in Ramadi city

The current study including investigating the effect of noise pollution produced by the diesel power generators on the public health, in one of Al-Ramadi districts. The measurements were taken using decibel meters within different distances and directions from the power station. The study showed that the noise levels are too high for the residential buildings, especially for the regions in which buildings are stacked together or distributed in a way that the sound wave is improved through the eco caused by this distribution.
