In the title hydrazinecarbodithioate derivative, $C_{27}H_{26}N_2O_2S_2$, the asymmetric unit is comprised of four molecules ($Z = 8$ and $Z' = 4$). The 4-methoxyphenyl rings are slightly twisted away from their attached olefinic double bonds [torsion angles = 5.9 (4)–19.6 (4) $^\circ$]. The azomethine double bond has an *s-trans* configuration relative to one of the C=C bonds and an *s-cis* configuration relative to the other [C=C–C=N = 147.4 (6)–175.7 (2) and 15.3 (3)–37.4 (7) $^\circ$, respectively]. The torsion angles between the azomethine C=N double bond and hydrazine-1-carbodithioate moiety indicate only small deviations from planarity, with torsion angles ranging from 0.9 (3) to 6.9 (3) $^\circ$ and from 174.9 (3) to 179.7 (2) $^\circ$, respectively. The benzyl ring and the methylenesulfanyl moiety are almost perpendicular to each other, as indicated by their torsion angles [range 93.7 (3)–114.6 (2) $^\circ$]. In the crystal, molecules are linked by C–H \cdots O, N–H \cdots S and C–H \cdots π (ring) hydrogen-bonding interactions into a three-dimensional network. Structural details of related benzyl hydrazine-1-carbodithioate are surveyed and compared with those of the title compound.

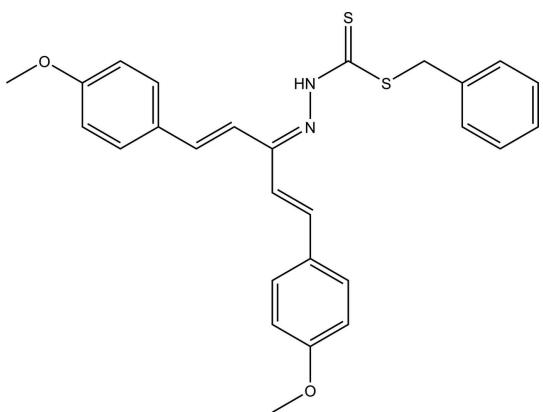

1. Chemical context

S-benzyl and *S*-alkyl dithiocarbazates are interesting ligands in coordination chemistry because they can act as *N,S*-chelating agents because of the presence of soft sulfur and hard nitrogen donor atoms (Takjoo *et al.*, 2016). These types of ligands can form stable metal complexes with five-membered chelate rings, and with transition metals in different stable oxidation states (Centore *et al.*, 2013). Dithiocarbazate Schiff bases and their metal complexes show a wide range of biological activities such as anti-malarial, anti-bacterial, anti-viral and anti-tumour (Low *et al.*, 2016; Nanjundan *et al.*, 2016; Islam *et al.*, 2016a). *S*-benzyldithiocarbazate and *S*-alkyldithiocarbazate Schiff base derivatives formed with aromatic aldehydes and ketones as well as their metal complexes have attracted attention due to their cytotoxicity against many types of cancer cell lines (Yusof *et al.*, 2016; 2017a,b; Vijayan *et al.*, 2015; Basha *et al.*, 2012), whereby *S*-methyl and *S*-benzyl dithiocarbazate Schiff bases with 2-acetylpyridine show better cytotoxicity against a breast cancer cell line (MDA-MB-231) than their transition-metal complexes (Hamid *et al.*, 2016). Furthermore, Schiff bases synthesized from the reaction of *S*-benzyldithiocarbazate and *m*-hydroxyacetophenone as well as their metal complexes exhibit moderate analgesic and good anti-inflammatory activities in comparison with standard

OPEN ACCESS

drugs diclofenac sodium and indomethacin (Mahapatra *et al.*, 2017).

Encouraged by previous findings on various properties of related Schiff base derivatives, we report herein the synthesis and structure determination of the title compound (**I**). Structural details of (**I**) are compared with other hydrazinecarbodithioates.

2. Structural commentary

The asymmetric unit of (**I**) consists of four molecules, denoted as *A*, *B*, *C* and *D*. Orientational disorder of the 1,5-bis(phenyl)penta-1,4-dien-3-ylidene amine moiety in molecule *B* and of the phenylmethyl moiety in molecule *D* were observed. The molecules are composed of a 1,5-bis(4-methoxyphenyl)penta-1,4-dien-3-ylidene moiety, connected to a benzyl ring by a hydrazine-1-carbodithioate ($-C(=N)-(NH)-C(=S)-S-C-$) bridge (Fig. 1). Conformational details of the 1,5-bis(4-methoxyphenyl)penta-1,4-dien-3-ylidene moiety can be described by the torsion angles between the 4-methoxy moiety and the phenyl ring [τ_1 ($C_2-C_3-O_1-C_{26}$); τ_6 ($C_{16}-C_{15}-O_2-C_{27}$)], between the 4-methoxyphenyl ring and the olefinic double bond [τ_2 ($C_5-C_6-C_7-C_8$); τ_5 ($C_{17}-C_{12}-C_{11}-C_{10}$)], and between the olefinic double bond and the azomethine double bond [τ_3 ($N_1-C_9-C_8-C_7$); τ_4 ($N_1-C_9-C_{10}-C_{11}$)]. Torsion angles τ_1 and τ_6 are approximately 0° or $\pm 180^\circ$ in the majority of the four molecules, except molecule *C* which has a τ_1 of $20.9(3)^\circ$ (Table 1). The 4-methoxyphenyl rings in the 1,5-bis(4-methoxyphenyl)penta-

Table 2Selected dihedral angles ($^{\circ}$).

Dihedral angle 1 is the dihedral angle between the mean planes of the 4-methoxyphenyl rings; dihedral angle 2 is the dihedral angle between the mean planes of the benzyl (C20—C25) and 4-methoxyphenyl (C1—C6) rings; dihedral angle 3 is the dihedral angle between the mean planes of the benzyl (C20—C25) and the 4-methoxyphenyl (C12—C17) rings.

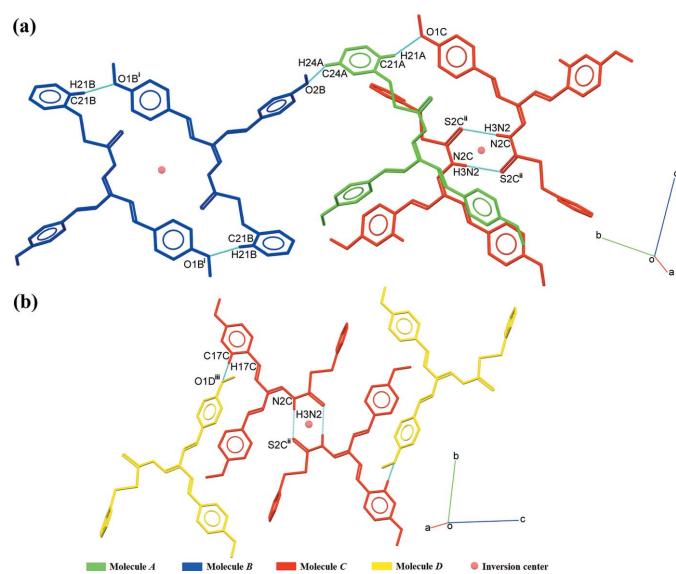

Molecule	Dihedral angle 1	Dihedral angle 2	Dihedral angle 3
A	56.72 (11)	85.02 (11)	72.11 (2)
B	89.6 (5)	31.6 (5)	64.9 (3)
C	23.59 (12)	84.46 (12)	86.00 (13)
D	60.82 (12)	36.6 (8)	89.9 (8)

1,4-dien-3-ylidene) moiety are twisted away from their attached olefinic double bonds [$\tau_2 = 5.9$ (4)–16.4 (13) $^{\circ}$; $\tau_5 = 7.5$ (3)–19.6 (4) $^{\circ}$]. The orientations of the the azomethine double bond with its neighbouring olefinic double bonds relative to the intermediate C–C bond (C8—C9; C9—C10) are different: one is in *s-trans* [$\tau_3 = 147.4$ (6)–175.7 (2) $^{\circ}$] conformation and the other in *s-cis* [$\tau_4 = 15.3$ (3)–37.4 (7) $^{\circ}$] conformation. The dihedral angles between two 4-methoxy-

phenyl rings in an individual molecule are in the range 23.59 (12)–89.6 (5) $^{\circ}$ (Table 2). Conformational details of the benzyl hydrazine-1-carbodithioate moiety can be outlined by torsion angles τ_7 (C9—N1—N2—C18), τ_8 (N1—N2—C18—S1), τ_9 (N2—C18—S1—C19), τ_{10} (C18—S1—C19—C20) and τ_{11} (S1—C19—C20—C21). In all molecules of (I), the hydrazine-1-carbodithioate bridges are more or less planar (ideal values τ_7 , τ_8 and τ_9 = 0 or $\pm 180^{\circ}$; experimental values: 0.9 (3)–6.9 (3) $^{\circ}$ and 174.9 (3)–179.7 (2) $^{\circ}$, respectively). The torsion angles between the sulfane moiety and the methylene moiety indicate a slight twist [$\tau_{10} = 160.53$ (17)–163.36 (16) $^{\circ}$]. These contortions are more severe between the benzyl ring and the methylene sulfane moiety where τ_{11} is considerably smaller [$\tau_{11} = 93.7$ (3)–114.6 (2) $^{\circ}$]. The dihedral angles between the benzyl ring and the two 4-methoxyphenyl rings are in the range 31.6 (5)–89.9 (8) $^{\circ}$ (Table 2). An overlay of the four molecules in the asymmetric unit was created with OLEX2 (Dolomanov *et al.*, 2009) and is shown in Fig. 2.

**Figure 3**

3. Supramolecular features

In the crystal, molecule *A* is interconnected to molecule *B* and molecule *C* through weak C24A—H24A···O2B and C21A—H21A···O1C hydrogen-bonding interactions. Molecules *B* and *C* each form inversion-related dimers *via* C21B—H21B···O1B and N2C—H3N2···S2C interactions, respectively (Fig. 3*a*). In addition, molecule *C* and molecule *D* are connected through C17C—H17C···O1D hydrogen bonds (Fig. 3*b*). The four molecules are linked into an endless chain parallel to [021] through the combination of these hydrogen bonds (Fig. 4). Further interactions, namely N2A—H1N2···S2A, N2B—H2N2···S2D and N2D—H4N2···S2B, link the chains into a three-dimensional network, as shown in Fig. 5. Additional C—H··· π interactions (Table 3) consolidate the packing.

4. Database survey

A search of the Cambridge Structural Database (CSD, version 5.40, last update May 2019; Groom *et al.*, 2016) using benzyl 2-(λ^2 -methylene)hydrazine-1-carbodithioate as reference

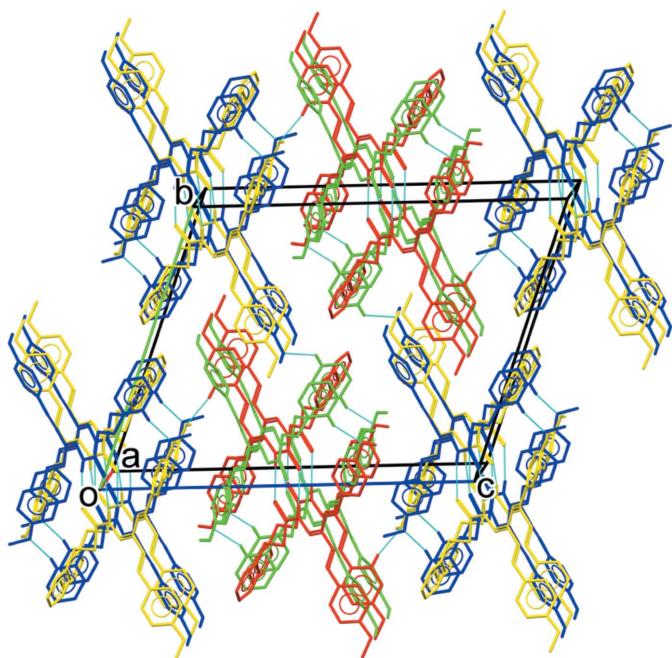

Figure 5

The overall packing of the title compound, viewed approximately along the *a*-axis direction.

moiety resulted in 45 structures with different substituents. The reference moiety and relevant torsion angles are illustrated in Fig. 6. Details regarding different substituents (*R*₁) together with the torsion angles for the benzyl hydrazine-1-carbodithioate moiety in these structures are collated in Table 4. In analogy with the title molecules, the planarity of the hydrazine-1-carbodithioate bridge for these structures is indicated by the τ_7 , τ_8 and τ_9 , torsion angles τ_7 and τ_9 range from 165.1 to 180.0° and indicate an *anti*-periplanar conformation whereas torsion angle τ_8 is indicative of a *syn*-periplanar conformation (0.0–9.1°). With respect to torsion angle τ_{10} , most of the structures adopt an *anti*-periplanar conformation ranging from 159.5 to 180.0°, but there are nine structures that adopt either a *syn*-clinal or an *anti*-clinal

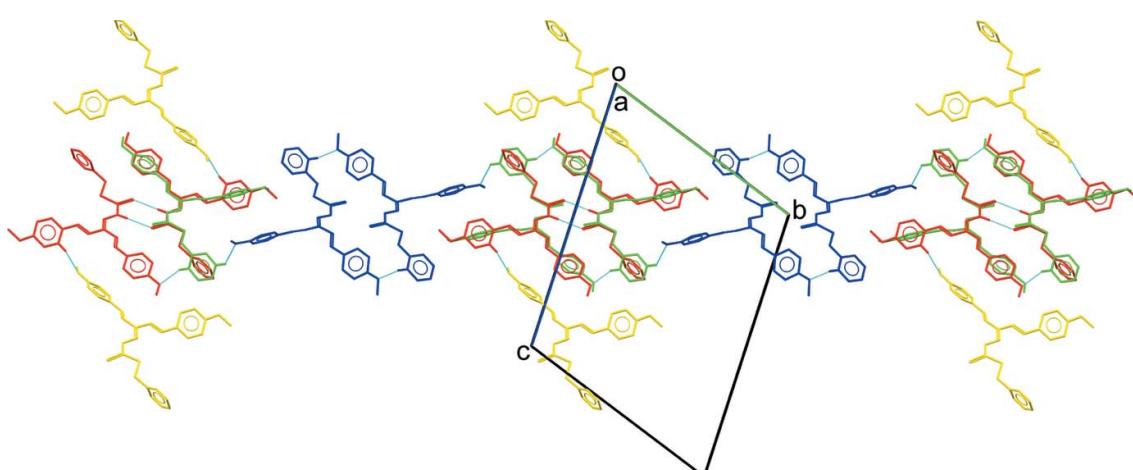

Figure 4

A partial packing diagram of the title compound showing molecules linked into chains by N—H···S and C—H···O interactions.

Table 4Torsion angles τ_7 , τ_8 , τ_9 , τ_{10} and τ_{11} ($^\circ$) in related hydrazinecarbodithioates.

Two sets of torsion angles are stated for compounds EXINAB, QORJAK, SIMMUX, VOJGUX and WUPGIX because there are two molecules in their asymmetric units. The molecule with disorder in the structure of compound ZENLIN was omitted from this table.

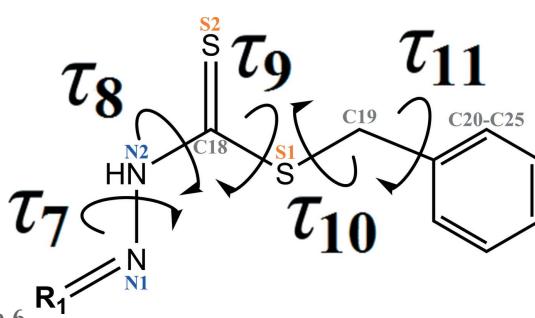

Figure 6
General chemical scheme showing the definition of torsion angles, τ_7 , τ_8 , τ_9 , τ_{10} and τ_{11} in the benzyl hydrazine-1-carbothioate moiety.

conformation ($77.6\text{--}110.4^\circ$). In most of the structures, the benzyl ring and the methylene sulfane moiety are orientated almost perpendicular to each other, as indicated by torsion angle τ_{11} . Here, either a *syn*-clinal ($68.1\text{--}88.4^\circ$) or an *anti*-clinal ($92.2\text{--}141.1^\circ$) conformation is adopted. However, there is one outlier (WADGAK; Chan *et al.*, 2003) where the benzyl hydrazine-1-carbothioate moiety is substituted with a 1-(thiophen-2-yl)ethylidene moiety. In contrast to most of the structures, torsion angle $\tau_{11} = 17.1^\circ$ for WADGAK indicates a *syn*-periplanar conformation.

5. Synthesis and crystallization

Compound (**I**) was synthesized following a well-described literature protocol (Ali & Tarafder, 1977; Ravoof *et al.*, 2010; Omar *et al.*, 2014). *S*-benzyldithiocarbazate (1.98 g, 0.01 mol) was dissolved in absolute ethanol (50 ml) under heating and stirring. The resulting solution was slowly added to a hot solution of di-*p*-methoxybenzalacetone (2.94 g, 0.01 mol) dissolved in absolute ethanol (50 ml). 3–5 drops of concentrated hydrochloric acid were added to the mixture, which was subsequently heated and stirred for 5 h (Fig. 7). The acidified mixture was allowed to stand overnight, resulting in the formation of red crystals. They were filtered off and recrystallized using the slow evaporation technique from absolute ethanol as solvent.

Yield: 57.3%. m.p.: 375–376 K. Analysis calculated for $C_{27}H_{26}N_2O_2S_2$: C, 49.71; H, 5.52; N, 5.90; S, 13.51% found: C, 49.68; H, 5.48; N, 5.97; S, 13.55%. FT-IR (cm^{-1}): 3145, $\nu(\text{N}-\text{H})$; 1630, $\nu(\text{C}=\text{N})$; 1244, $\nu(\text{N}-\text{N})$; 1059, $\nu(\text{C}=\text{S})$; 3145. ^1H NMR (CDCl_3) δ (ppm) = 6.55–7.68 (aromatic H); 3.85 (OCH_3); 4.55 ($-\text{CH}_2$ benzyl); 10.20 (N–H). ^{13}C NMR (CDCl_3) δ (ppm) = 114.35–142.88 (aromatic C); 55.55 (OCH_3); 39.34 ($-\text{CH}_2$ benzyl); 161.22 (C=N); 206.91 (C=S). m/z calculated for $C_{27}H_{26}N_2O_2S_2$: 474, found 474.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 5. The labelling of atoms is the same in each molecule, with the molecule indicated by the suffix *A*, *B*, *C* or *D*. The N-bound H atoms were located in difference-Fourier maps and were refined freely [N–H = 0.81 (3)–0.91 (4) Å]. The C-bound H atoms were positioned geometrically (C–H = 0.93–0.97 Å) and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$. A rotating-group model was applied to the methyl groups. The 1,5-bis(phenyl)penta-1,4-dien-3-ylidene amine moiety in molecule *B* and the phenylmethyl moiety in molecule *D* display positional disorder, with refined site occupancy ratios of 0.667 (7):0.333 (7) and 0.653 (15):0.347 (15), respectively (SIMU, DELU and SAME restraints were used).

$$\Delta\rho_{\min} = -0.62 \text{ e \AA}^{-3}$$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry (Å, °)

Cg1, Cg2 and Cg3 are the centroids of the C12B—C17B, C12C—C17C and C1B—C6B rings, respectively.
